This sequence is a peptide homologue of a region of p53 which binds to mdm2. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in production of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the clearance of p53 by income of p53 to increase by function. The agents for use in therapeutics for activate p53 function. The agents for use in therapeutics for activate p53 used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.

AAW82319 standard; Peptide; 19 AA. AAW82319

AAW82319;

22-FEB-1999 (first entry)

p53 homologue TIP peptide.

p53; mdm2; inhibitor; therapy; activator; treatment; cancer; medicament.

Synthetic.

W09847525-A1.

29-OCT-1998.

Compounds binding to MDM2 protein and inhibit its interaction with p53 - useful in, e.g. diagnosis and treatment of cancer and viral infections and identifying binding agents

New agents which inhibit interaction of p53 and mdm2 - useful for activating p53, e.g. for treating cancers, viral conditions or other conditions associated with non functional p53 or mdm2

Disclosure, Fig 1; 52pp; English.

This sequence is a peptide homologue of a region of p53 which binds to made. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in apoulation of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpess mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by inhibiting the clearance of p53 by mdm2, and can be used to activate p53 function. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.

This represents a p53 N-terminal peptide fragment used in an Elisa TIP assay for analysing the interaction between human encogenic protein MDM2 assay for analysing the interaction between human encogenic protein MDM2 and p53. The invention provides peptide derivatives capable of binding to the human MDM2 These peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated composits in tumour cells our provision and induce that bind levels of MDM2. The peptides may be used to identify and design inhibitors of MDM2, p53 binding. They to MDM2 and to identify and design inhibitors of MDM2, p53 binding. They compared the poptides of MDM2, and leukaemia classase how measuring levels of MDM2 in blood of cancer and leukaemia chiesease involving p53/MDM2 contents and for treatment or prevention of disease involving p53/MDM2 contents and for treatment or prevention of disease involving p53/MDM2 contents and interactions. Phe peptides can administered nasally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can accivate p53 function and accumulation in normal cells. The peptides which mind; the MDM2 banding content with wild-type p53. <u>`</u> Gaps ; Length 18; 0; Indels 94.3%; Score 99; DB 19; L 100.0%; Pred. Peptides AAW60202-05 are derived from human p53 protein. The present peptide corresponds to residues 11-35. The peptides are used in the method of the invention. Antibodies that bind to p53 protein are detected by immobilising a p53 peptide directly on to a flow cell of patient serum, diluted in buffer, and measuring binding of antibody to the peptide using the biosensor. The method is used to monitor cancer patients undergoing p53 gene therapy (to determine if an immune response has developed), and also to detect antibodies against mutant forms of p53. Novel methods for the synthesis of biologically active compounds from inactive precursors in the cells of living organisms, useful for producing proteins or polynucleotides -

Example 8; Page 29; 65pp; English.

The specification describes a method of synthesis of biologically active substances of determined structure directly in the cells of living organisms containing specific RNA or DNA sequence. The method is based on the hybridisation of two or more oligomers bound with biologically inactive substances to specific RNA or DNA in vivo in the cells of living organisms. After hybridisation of the oligomers, the biologically inactive precursors bound to the oligomers can interact with each other to make the active form of the substances. This changing of properties is due to chemical reactions which bind the biologically inactive precursors through a chemical bond into a biologically active form of

active compounds from inactive precursors. These compounds may be active compounds from inactive precursors. These compounds may be transcription, RNA translation, RNA elongation RNA processing, protein synthesis, protein processing, cellular differentiation, cell division, synthesis, protein processing, cellular protein and RNA transportation, cellular protein and RNA transportation, processes of cellular oxidation, cellular protein and RNA transportation, processes of cellular oxidation, cellular protein and RNA transportation, processes of cellular oxidation, cellular protein and RNA transportation, cellular proteins or RNAs. AAB3023-36 represent peptides which are bound to oligomers AAC62167-80 and AAC62181-94. The peptides are fragments of the tumour suppressor p53, and the oligomers are antiparallel to human plasminogen antipan activator mRNA (AAC62167-80) or human NDHOT (AAC62181-94). The method of the invention is used to produce the tumour suppressor protein p53 from the bound peptides and oligomers. the whole compound. The methods are useful for producing biologically 32 AA; Sequence

Treating cancer with antagonist of oncogenic activity of protein Mdm2 - or nucleic acid encoding an antagonist, also viral vectors contg. this nucleic acid

Claim 4; Page -; 43pp; French.

wild type human p53 protein. This peptide corresponds to amino acids 6-41 of the p53 sequence. The peptides are claimed peptides which are able to bind the N-terminal amino acids (1-134) of the murino double minute-2 (mdm2) protein (AAM13600). Mdm2 protein is a 90 KD phosphoprotein which binds and modulates the activity of the tumour suppressor protein p53. It has now been shown that the mdm2 protein itself has oncogenic properties, especially in a p53-mul background. Mdm2 is observed to unblock cell cycle arrest in G1 caused by The peptides AAW13602-6 represent peptide fragments derived from the

constructed from the wild type human p53 sequence.

over-expression of the p107 protein. The p53 peptides are examples of antagonists of the invention which are able to inhibit the oncogenic activity of mdm2. The antagonists are used to treat e.g. adenocarcinoma of the colon; cancer of the breast, lung or stomach; myeloid leukaemia; Ecall lymphoma, or other hyperpoliferative conditions such as restenosis. Note: this sequence is not given in the specification but is constructed from the wild type human p53 sequence.

The peptides AAW13602-6 represent peptide fragments derived from the wild type human p53 protein. This peptide corresponds to amino acids 1-52 of the p53 sequence. The peptides are claimed peptides which are able to bind the N-terminal amino acids (1-134) of the murine double computed. (mdm2) protein (AAW1360). Mdm2 protein is a 90 kD phosphoprotein which binds and modulates the activity of the tumour cruppressor protein p53. It has now been shown that the mdm2 protein crublors protein crublock cell cycle arrest in G1 caused by cover-expression of the p107 protein. The p53 peptides are examples of antagonists of the invention which are able to inhibit the oncogenic cutivity of mdm2. The antagonists are used to treat e.g. adenocarcinoma of the north are able to inhibit the oncogenic activity of mdm2. The antagonists are used to treat e.g. adenocarcinoma of the breast, lung or stomach; myeloid leukaemia; B cell lymphoma, or other hyperproliferative conditions such as constructed from the wild type human p53 sequence.

```
This sequence represents the product of the p53 gene. p53 is a tumour suppressor gene and this protein appears to be a member of a group of proteins which regulate normal cellular proliferation and suppression of cellular transformation. Inactivation of the p53 gene has been implicated in the formation, or progression of a wide variety of carcinoma. p53 is thought to interact with the protein product of a gene which is amplified in a number of human tumours, designated MDM2. Polypeptides containing at least amino acids 13-41 of p53, or the DNA encoding these, may be used to inhibit the growth of tumour cells containing MDM2 gene amplification.
                                                                                                                                                                                p53 gene; tumour suppressor gene; regulation; cellular proliferation; cellular transformation; carcinoma; human; tumour; MDM2; inhibition;

AAW07886 represents the human p53 protein which is involved in the development of many cancers. The protein is used here in a method for identifying compounds that interfere with the binding of p53 and NDM-2. In binding the p53 protein, the MDM-2 protein releases a cell from p53-regulated growth, allowing cancers to develop. Therefore compounds identified as interfering with the binding of MDM-2 to p53 are potentially useful in the treatment of human neoplastic cells. In the method pref. one or both of the proteins is a fusion protein esp. with an antibody or antibody fragment which aids separation and identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identification of cpds. interfering with human MDMZ/p53 binding useful as therapeutic agents to treat human neoplastic cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

The present sequence represents a human p53 fragment 13-41 which is necessary for the interaction of MDM-2 and p53. The present invention describes a method for diagnosing a neoplastic disease caused by overexpression of MDM2 protein. The method comprises detecting an elevated cellular amount of this protein. The method is useful for the diagnosis of sarcoma, especially liposarcoma, malignant fibrous histiocytoma or osteosarcoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human MDM2 binding polypeptide - comprises fragments of p53, useful in re-establishing p53-regulated growth control in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MDM2; tumour; diagnosis; neoplasia; DNA binding protein; p53 polypeptide; binding; tumour cell; p53-regulated growth; inhibition; anti-cancer agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 99; DB 19; Length 64;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The method has been developed for inhibiting the growth of tumour cells containing a human MDM2 gene amplification. The method comprises treating the tumour cells with a DNA molecule that expresses a polypeptide capable of binding to human MDM2 protein. The present comprises a polypeptide capable of binding to human MDM2 protein. The present capable of present invention describes three preferred polypeptides for binding human MDM2: (1) the polypeptide comprises amino acids 1-50 of p53 (see AAW7240); (2) the polypeptide comprises amino acids 13-41 of p53 (see AAW7240) and at least none additional p53 residues on the N- or C-terminal side, provided that the polypeptide comprises amino acids 13-41 of p53 (see AAW57241) and at least nine comprises amino acids 13-41 of p53 (see AAW57241) and at least nine comprises amino acids 13-41 of p53 (see AAW57241) and at least nine polypeptide lacks amino acids 13-93 of p53; Some malignant fibrous histocytomas and liposarcomas have an MDM2 gene amplification, so detection of increased expression of MDM2 gene products indicates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

over-expressing MDM2

Claim 1; Columns 19-20; 41pp; English.

The present sequence represents a N-terminal portion of the p53 protein. These amino acid residues have been found to be necessary for the interaction of MDM2 and p53. A cell containing three recombinant but constructs was produced. These constructs encode an MDM2 protein fused to a sequence-specific DNA binding domain, a p53 polypeptide fused to a transcriptional activation domain, and a reporter gene downstream from a DNA element which is recognised by the sequence-specific DNA-binding domain. The cell is used to identify a compound which interferes with the binding of MDM2 and p53. Since MDM2 is overexpressed in tumour cells and since binding of MDM2 to p53 appears to allow tumour cells to escape from p53-regulated growth, compounds that inhibit such binding would be useful as anti-cancer agents.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Description: Nucleotide sequence of the ovine p53 tumor-suppressor gene cDNA and its A;Reference number: S51648
A;Accession: S51648
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cellular tumor antigen p53 - golden hamster
NyAlternate names: tumor-suppressor protein p53
Cispecies: Mesocricetus auratus (golden hamster)
Cispecies: Mesocricetus auratus (golden hamster)
Cispecies: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 10-Sep-1999
Cisaccesion: UH6633

Glutamate receptor delta-1 chain precursor - rat
NyAlternate names: Asinate receptor
NyAlternate names: Asinate receptor
C;Species: Rattus norvegicus (Norway rat)
C;Species: Rattus norvegicus (Norway rat)
C;Date: 07-Apr-1994 #sequence_revision 07-Apr-1994 #text_change 20-Aug-1999
C;Accession: S28857; S31222
C;Accession: S28857; K.; Laurie, D.J.; Koehr, G.; Herb, A.; Seeburg, P.H.; Wisden, W.FEBS Lett. 315, 318-322, 1993
A;Pitle: The rat delta-1 and delta-2 subunits extend the excitatory amino acid receptor
A;Reference number: S28857; MUID:93138096; PMID:8422924
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Experimental source: liver C; Comment: This protein is the product of a tumor suppressor gene, p53, whose inactivating c; Comment: This protein is the product of a tumor antigen p53 C; Superfamily: cellular tumor antigen p53 C; Keyworks: apoptosis; cell division control; DNA binding; homotetramer; nucleus; phosph F; 164, 167, 227, 231/Binding site: zinc (Cys, His, Cys, Cys) #status predicted F; 395/Binding site: phosphoryl-RNA (Ser) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A; Introns: 25/2; 32/3; 123/3; 185/1; 259/2; 305/1; 329/3; 365/2 C; Superfamily: cellular tumor antigen p53 C; Superfamily: cellular tumor antigen p53 C; Superfamily: cell division control; DNA binding; homotetramer; nucleus; phosph F;174,177,236,240/Binding site: zinc (Cys, His, Cys, Cys) #status predicted F;390/Binding site: phosphoryl-RNA (Ser) (covalent) #status predicted

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCl-2

Nucleic Acids Res. 17:875-8375(1989).

**INUCLION: Acts as a tumor suppresor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCI-2
                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expression.
SUBDNIT: Binds DNA as a homotetramer (By similarity).
SUBCELLULAR LOCATION: Nuclear.
DISBASE: PS1 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY
OF TRANSFORMED CELLS. PS3 IS FREQUENTLY MUTATED OR INACTIVATED
IN MANY TYPES OF CANCER.

In FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCI-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SUBUNIT: Binds DNA as a homotetramer (By similarity).
SUBCELLULAR LOCATION: Nuclear.
DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY
OF TRANSFORMED CELLS. P53 IS FREQUENTLY MUTATED OR INACTIVATED

Submitted (FEB-1996) to the EMBL/GenBank/DDBJ databases.

FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                        TISSUE-Blood;

"Wild-type p53 sequence of tree shrews.";
"Wild-type p53 sequence of tree shrews.";
Submitted (AuG-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Acts as tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bc1-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            expression.
--- SUBUNIT: Binds DNA as a homotetramer (By similarity).
---- SUBCELLULAR LOCATION: Nuclear.
--- DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY
OF TRANSFORMED CELLS. P53 IS FREQUENTLY MUTATED OR INACTIVATED
IN MANY TYPES OF CANCER.

-I- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BASIC (REPRESSION OF DNA-BINDING),

Submitted (APR-1997) to the EMBL/GenBank/DDBJ databases.

-I-FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and call type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCI-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Komori H., Ishiguro N., Horiuchi M., Shinagawa M., Aida Y.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBUNIT: Binds DNA as a homotetramer (By similarity).
SUBCELLULAR LOCATION: Nuclear.
DISEASE: P53 IS FOUND IN INVERASED AMOUNTS IN A WIDE VARIETY
OF TRANSFORMED CELLS. P53 IS FREQUENTLY MUTATED OR INACTIVATED
IN MANY TYPES OF CANCER.
                                                                                                                                                         Bos indicus (Zebu).

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinasses. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BGl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MEDLINE-97376996; PubMed=9233767; Feitelson M.A., Ranganathan P.N., Clayton M.M., Zhang S.M.; Feitelson M.A., Ranganathan P.N., Clayton M.M., Zhang S.M.; "Partial characterization of the woodchuck tumor suppressor, p53, and its interaction with woodchuck hepatitis virus X antigen in Oncogene 15:327-336(1997).

--- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinasses. Apoptosis induction seems to be mediated either by stimulation of BAZ and FAS antigen expression, or by repression of Bc1-2
                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TISSUE=Leukocyte;

Vet. Med. Sci. 55:801-805(1993).

-! FUNTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bc1-2
                                                                                                                                                                                                                                                                                                                                                        Gaps

Shimizu T., Nikaido O., Suzuki F.;
Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                       BASIC (REPRESSION OF DNA-BINDING).

Hou E.W., Wiseman R.;
Submitted (APR-1994) to the EMBL/GenBank/DDBJ databases.
-! FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BY SIMILARITY.

-!- SUBUNIT: Binds DNA as a homotetramer (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear.
-!- DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY
OF TRANSPORMED CELLS. P53 IS FREQUENTLY MUTATED OR INACTIVATED
IN MANY TYPES OF CANCER.
-!- SIMILARITY: BELONGS TO THE P53 PAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EMBL; M75144; AAA37085.1; -. "Hyaluronidase Induction of a WW Domain-Containing Oxidoreductase that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enhances Tumor Necrosis Factor Cytotoxicity.";

J. Blol., Chem. 276;13361-3370(2001).

-!- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, IS A TRANS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES. APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Caracterization of the human p53 gene.";

Mol. Cell. Biol. 6:1379-1385(1986).

-!- FUNCTION: ACTS AS A TUMOR SUPPRESSON IN MANY TUMOR TYPES. INDUCES GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSTOLOGICAL CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, IS A TRANS-ACTIVATED GENES IS TO NEGATIVELY REGULATION, IS A TRANS-CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2

EXPRESSION (BY SIMILARITY).

C. -1- SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

C. -1- DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY OF TRANSFORMED CELLS. P53 IS FREQUENTLY MITATED OR INACTIVATED IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Isolation and characterization of a human p53 cDNA clone: expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Activator; Anti-oncogene; Apoptosis; DNA-binding; Nuclear protein;

CIRCHORTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES C. I- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN THE PHYSIOLOGICAL GROWTH ARREST OR APPOPTOSIS DEPENDING ON THE PHYSIOLOGICAL INVOLVED IN CIRCHARTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATE CELL DIVISION BY ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASS. APPOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2

EXPRESSION (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

-!- DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY OF TRANSFORMED CELLS. PS3 IS FREQUENTLY MITATED OR INACTIVATED IN MANY TYPES OF CANCER (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL; X60011; CAA42626.1; -.

CHONCITION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES GROWTH ARREST OR APOPTOSIES DEPENDING ON THE PHYSICLOGICAL CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, IS A TRANSCRIPTOR THAT ACTS TO MEGATIVELY REGULATE CELL DIVISION BY ACTIVATION THAT ACTS TO MEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES. APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION OR BY REPRESSION OF BCL-2 EXPRESSION OR BY SIMILARITY).

CHOSTOLILAR HOCATION: NUCLEAR (BY SIMILARITY).
